TESTIMONY OPPOSING MINNESOTA HF1256 THERAPY BAN BILL
INTERNATIONAL FEDERATION
FOR THERAPEUTIC AND COUNSELLING CHOICE
Laura Haynes, Ph.D., General Board Member and USA Country Representative
March 2, 2022

Honorable Chair Freiberg and Members of the Committee,

I am Dr. Laura Haynes, psychologist and general board member representing the International Federation for Therapeutic and Counselling Choice (iftcc.org). We use evidenced based methods and well-established practices therapists use around the world and not aversive or coercive methods. We oppose this bill.

The American Psychological Association's *APA Handbook of Sexuality and Psychology* says same sex attraction and incongruent gender identity¹ are not simply biologically determined or who someone biologically is. It says there are psychoanalytic causes² and childhood sexual abuse may be a cause for some people having same sex partners.³ Rigorous studies in the US⁴ and Finland⁵ have found that psychiatric conditions and suicidality often exist BEFORE onset of adolescent gender incongruence, therefore may be causes for it. Treating causes may reduce resulting sexual attraction or gender feelings. There are professional organizations worldwide that support the right to this therapy.⁶

For people who do significantly reduce or change same-sex attraction through therapy, psychological well-being strongly improves.^{7 8} Even for people who do not change (they continue to identify as LGB), suicidality decreases. The leading study claiming harm, Blosnich 2020, used data collected for the Williams Institute at the University of California at Los Angeles.⁹ This study failed to compare lifetime suicidality rates before and after therapy. Studies that have been referred to today claiming proof of harm do not compare suicidality or psychological problems before and after change exploring therapy and admit their methods do not rightly allow them to conclude therapy causes harm. Harm-claiming studies regularly make this mistake, and professional organizations have based positions on them. When Sullins in 2022¹⁰ corrected this mistake using the Blosnich data set, the results turned upside down. Most of the lifetime suicidality was before therapy. Suicidality rates for people who do not change decreased to 5 times lower after change-exploring therapy. Unsurprisingly, people who were suicidal went to therapy more than people who were not suicidal, and therapy decreased their suicidality.

Contrary to some claims, the United Nations has no binding treaty that mentions change-allowing therapy at all. Many UN nations oppose a therapy ban.

For adolescent gender dysphoria, change-exploring therapists follow Finland's first line government Recommendation to resolve gender dysphoria by resolving predisposing psychiatric disorders and not changing bodies.¹¹

HF1256 punishes providing FINLAND'S first line government recommended treatment for adolescent gender dysphoria. THIS IS A DISASTER. There is NOT professional consensus in support of HF1256. We urge you, vote NO.
